

Welcome to the Universe of ETH Gobblers

Gamified Patronage utilizing blockchain technology and BasedMath by your friends at Omakasea

What is Elastic Supply?

Elastic supply refers to the combination of the novel burning mechanism (deflationary) and the ability to split your GOOEY into 2 separate GOOEYS (inflationary).

The initial GOOEY supply of the ETH Gobblers collection is 2000, but this number increases as GOOEYS undergo mitosis and decreases when GOOEYS die & get buried. GOOEY owners may perform various activities to keep GOOEYS alive, or let them die & pass on to the next realm.

What is a GOOEY?

A GOOEY is your own living, breathing, dynamic creature NFT that lives in a Super cute Tamagotchi-style mobile-first Web 3 dApp. GOOEYS need your love & support to thrive, divide into more GOOEYS, and drop gifts along the way.

Each GOOEY has its own base traits, disposition, taxonomy, and age. GOOEYS can also be equipped with unique additional traits, claimable by those who keep their GOOEYS happy and healthy.

Each GOOEY & the base traits were hand designed with love by Omakasea's very own Director of Arts: Didielle!

Age	Taxonomy	Disposition
22	BATH	HAPPY

Caring for your new GOOEY

Every GOOEY has a health bar which loses health points [HP] gradually over time. If your GOOEY's health bar runs out, your GOOEY dies and may get buried forever. This means if people don't care for their GOOEY, the supply will decrease. Keep in mind, as HP decreases, it becomes more difficult to care for your GOOEY.

What happens if your GOOEY's health goes to 0?

When your GOOEY's health falls to 0, it becomes at risk of getting buried. Anyone can call the "bury" function on a GOOEY that has lost all of its HP. Calling this function sends the GOOEY to the burn address. You can revive your GOOEY by feeding it before it gets buried to restore HP.

What happens when your GOOEY's health bar is full?

Your GOOEY is healthy & will reward you with prizes over time.

How much ETH does it take to split your GOOEY into two?

The amount it takes to split your GOOEY is proportional to the floor price of the collection, and is dependent on the elastic total supply. As supply grows, the amount of ETH to perform mitosis increases to slow inflation. As more GOOEYS get buried, the ETH to perform mitosis decreases to boost inflation.

Certain drops produced by healthy GOOEYS that when equipped, decrease the amount of ETH needed to undergo mitosis. For example, a rare drop gives you a 50% discount off of the base cumulative cost to split.

What can I do with the GOOEY my GOOEY buds?

Anything you want! Your new GOOEY is a whole new ERC-721 token which can be traded on secondary markets, gifted to a friend, given away to a community member, or kept safe in your wallet. Looking for more GOOEYS.

How can I gain Health Points (HP)?

You can raise your GOOEY's health by feeding ETH to your GOOEY, grooming it, or putting it to sleep.

Feed: Feed your GOOEY, 1x, 5x, or FEAST per TX. FEAST calculates the amount of ETH needed to undergo mitosis and feeds your GOOEY that amount.

Groom: Groom your GOOEY once per TX. Grooming increases your HP by a significantly larger amount than feeding.

Sleeping: Put your GOOEY to sleep once per TX. Sleeping restores 100% of HP but comes with side effects: Your GOOEY remains asleep for a random time (no longer than 1 week). While asleep, HP decreases at a slower than usual rate, and no feeding or grooming can be performed.

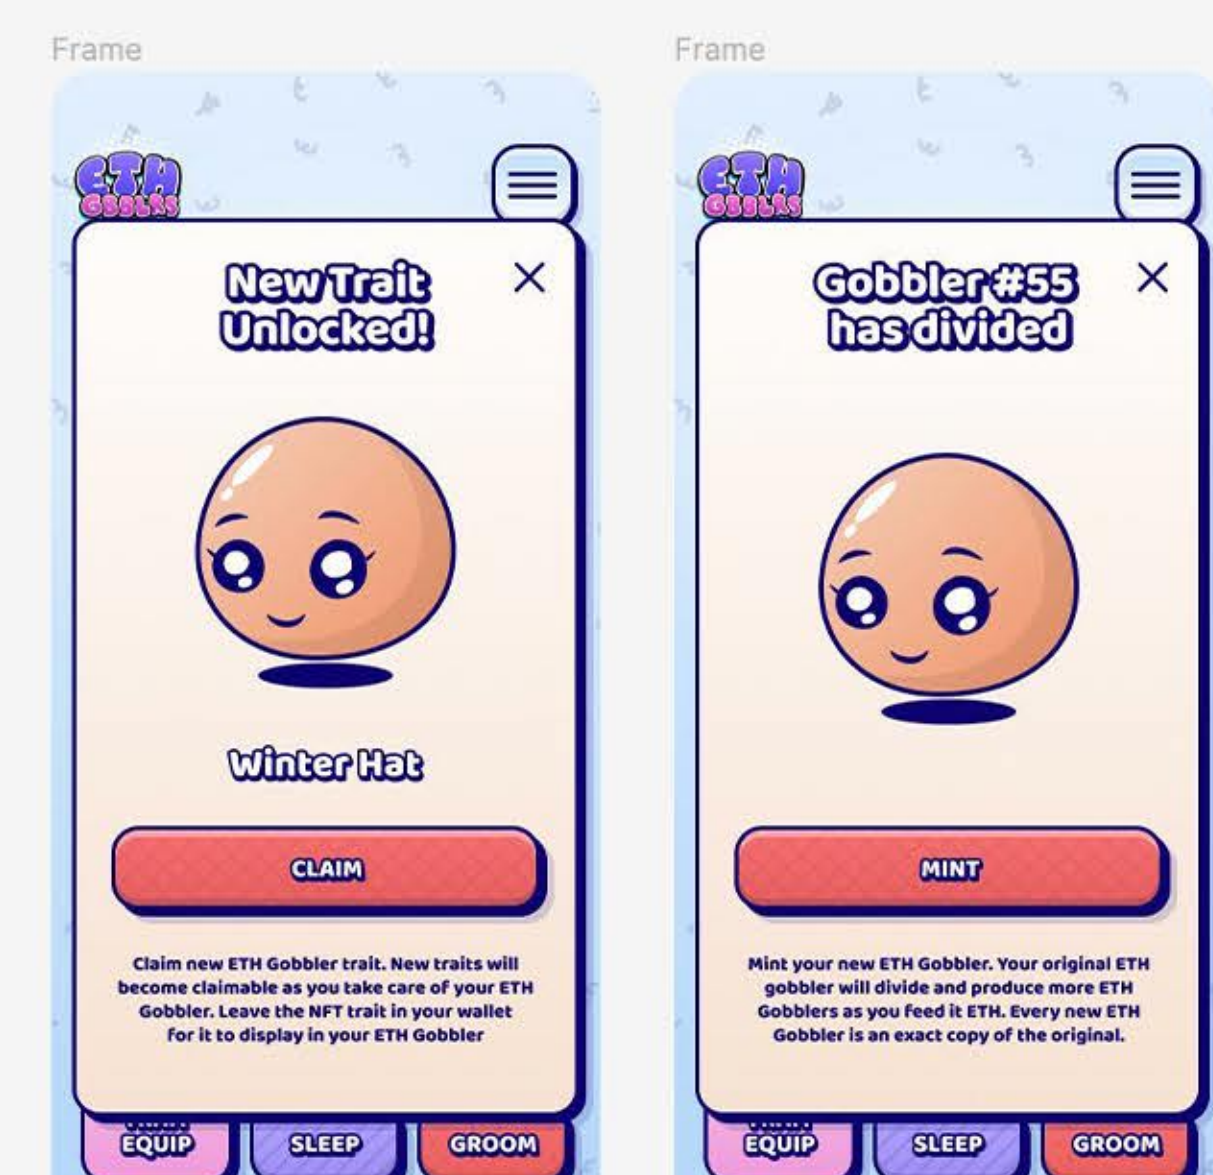

What other benefits are there to keep my GOOEY alive?

Traits: An endlessly growing collection of traits with variable rarity which can be claimed and unlocked to equip your GOOEY with various utilities.

Alpha: Secret in-app alpha drops (think: important nuggets from Twitter Spaces, insider secrets that are too spicy for public consumption, access to exclusive content, etc.)

One-of-one Art: Unlock unique one-of-one NFT artwork.

Where does the ETH you feed your GOOEY go?

The ETH you feed to your GOOEY goes back to the Omakasea development team. This ETH will be used for: putting food in our tank's mouths, supporting our families, and funding development of dope shit for the ecosystem (such as molth.tv, Omakasea.com, and others). We hope the ETH Gobblers model can be utilized by other teams/artists/devs to boost their operations through an ongoing flow of liquidity.

How can the ETH Gobblers model support artists/creators through a new form of gamified patronage?

ETH Gobblers is gamified to incentivize holders (via claimable drops, community access, or whatever the creator decides) to deposit ETH into a contract over time. We believe this is an ideal on-chain solution that functions as an alternative to Patreon, Koti, etc., and to help independent teams to get ahead.
